

Course: CSCL2101: Cloud Computing Essentials

Lab Title: Accessing Windows Instance using RDP

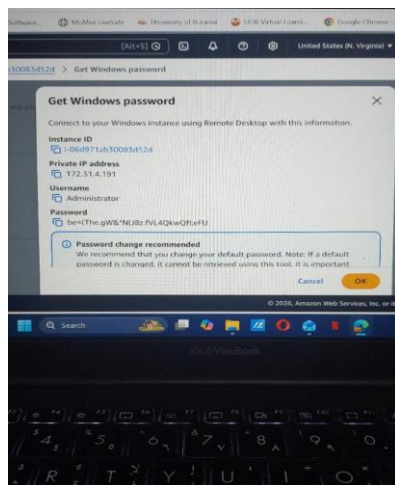

Student Name: Mahra Sulaiman AL-Shehhi

1. Lab Overview

In this lab, I successfully launched a Windows EC2 instance on AWS and connected to it using the Remote Desktop Protocol (RDP).

2. Decrypting the Administrator Password

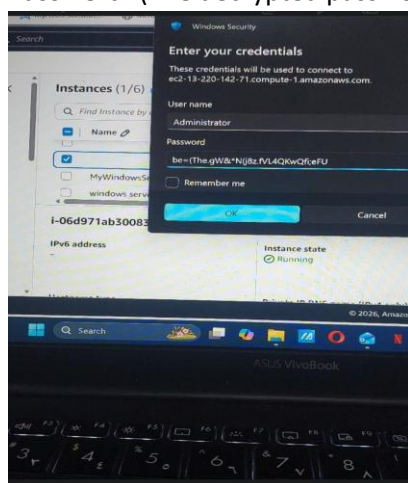

After the instance was running, I used the "**Get Windows Password**" feature. I uploaded the private key file (labsuser.pem) to decrypt the default administrator password.

3. Configuring Remote Desktop Connection

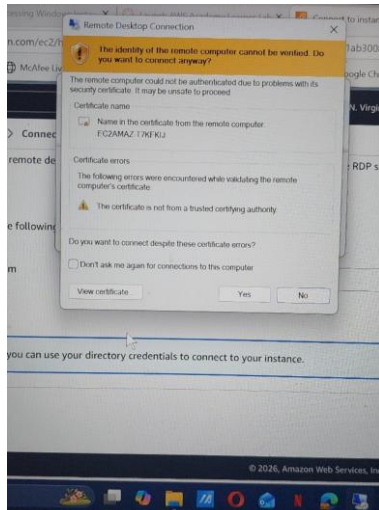

I opened the Remote Desktop Connection client on my computer. I entered the **Public IPv4 DNS** of the instance and provided the credentials:

- **Username:** Administrator
- **Password:** (The decrypted password obtained in the previous step)

4. Security Certificate Verification

A security warning appeared regarding the remote computer's identity. I clicked **"Yes"** to confirm and establish the encrypted connection.

5. Successful Access to Windows Instance

The connection was successful, and I gained full access to the Windows Server desktop environment.
